Gaps are shown by 200n. Genes were identified by a combination of several methods: Gene prediction programs including Figensesh (http://www.softberry.com/), genscan (http://ccr-081.mit.edu/GENSCAN.html), GeneMarkHMM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and Hong, G.F.

Q

The invention relates to a novel enzyme of starch biosynthetic pathway in a cereal plant, where the enzyme is selected from starch branching enzyme (SBE) I , SBE II, starch soluble synthase (SSS) I, and debranching enzyme (DBE), with the proviso that the enzyme is not SSS I of rice, or SBE I of

The methods and products can be used for targeting cc expression specifically to the endosperm of the seeds of cereal plants cc such as wheat or barley. They can be used for the expression of e.g. cc antisense sequences of granule-bound synthase (GBSS), SBE II, low mol. cc glycogen synthase, and wheat high mol. wt. glutenin Bx17. They can be used for modifying the characteristics of starch produced by a plant. The cc present sequence represents the SBE II gene sequence. The present sequence encodes a wheat starch branching enzyme of Aegilops tauschii, designated F2. A. tauschii is likely to be the ancestral D genome donor of wheat. Probes isolated from the present sequence were used to identify type II starch branching enzymes (SBEs) in wheat, especially BEIIb. The BEIIb nucleic acids may be used to genetically transform cereal plants such as wheat or barley and for altering their nutritional content by modulating the starch biosynthetic pathway to vary levels of amylopectin and/or amylose produced in the plant	Morell M, Rahman S; WPI; 2001-570635/64. Nucleic acids encoding wheat starch branching enzyme IIb, useful for altering the amylose and amylopectin content of cereal plants, e.g. wheat and barley.	21-FEB-2001; 2001WO-AU000175. 21-FEB-2000; 2000AU-00005742. The specification describes BEIIb BEIIb is a type II starch branching enzyme (SBE). The BEIIb nucleic acids may be used to genetically transform cereal plants such as wheat or barley and for altering their nutritional content by modulating the starch biosynthetic pathway to vary levels of amylopectin and/or amylose produced in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding wheat starch branching enzyme IIb, useful altering the amylose and amylopectin content of cereal plants, eand barley.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           30-AUG-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          describes a wheat starch branching enzyme, designated BEIID is type II starch branching enzyme (SBE). The BEIID nucleic acids may be used to genetically transform cereal plants such as wheat or barley an for altering their nutritional content by modulating the starch biosynthetic pathway to vary levels of amylopectin and/or amylose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Fig 4; 103pp; English.

The specification describes a wheat starch branching enzyme, designated BEIIb. BEIIb is a type II starch branching enzyme (SBE). The BEIIb nucleic acids may be used to genetically transform cereal plants such as wheat or barley and for altering their nutritional content by modulating the starch biosynthetic pathway to vary levels of amylopectin and/or amylose produced in the plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding wheat starch branching enzyme IIb, useful for altering the amylose and amylopectin content of cereal plants, e.g. wheat and barley.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; Fig 4; 103pp; English.

The specification describes a wheat starch branching enzyme, designated BSIIb. BEIIb is a type II starch branching enzyme (SBE). The BEIIb nucleic acids may be used to genetically transform cereal plants such as wheat or barley and for altering their nutritional content by modulating the starch biosynthetic pathway to vary levels of amylopectin and/or amylose produced in the plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and barley.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding wheat starch branching enzyme IIb, useful for altering the amylose and amylopectin content of cereal plants, e.g. wheat

The quality of starch improved by the use of the protein. (Updated on 25-MAR-2003 to correct field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method (MI) for identifying genes involved in plant resistance or response to pathogenic infection. MI comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to

The plant is selected from corn, tomato, banana, canola, cotton, peanut, sorghum, tobacco, sugarbeet, wheat, and rice. The invention may be useful for the improvement of protein, oil, starch, fibre and moisture content of the cereal grains. In addition, carbohydrate levels may be modified to a more desirable level using the present invention. The present sequence is a DNA sequence encoding a rice protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New plant genes encoding polypeptides having an activity involved in associated with the synthesis, metabolism or degradation of carbohydin the plant grain useful in generating plants having improved

BEIIb is a type II starch branching enzyme (SBE). The BEIIb nucleic acids may be used to genetically transform cereal plants such as wheat or bearley and for altering their nutritional content by modulating the starch blosynthetic pathway to vary levels of amylopectin and/or amylose produced in the plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding wheat starch branching enzyme IIb, useful for altering the amylose and amylopectin content of cereal plants, e.g. wheat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 6; Fig 9; 103pp; English.

This invention relates to the cDNA and protein sequences of a novel wheat companies to the cDNA and protein sequences of a novel wheat starch branching enzyme IIb enzyme. Starch branching enzymes are constant synthesis pathway. The nucleotide sequence in amylopectin in the constitution by the formation of alpha 1-6 linkages in amylopectin in the constitution synthesis pathway. The nucleotide sequence of the invention is constituted by the starch branching at transgenic plant expressing the starch branching construction is constituted by the construction of the protein is constituted by the constitution of the protein is constituted by the construction of the protein is constituted by the constitution of expression of a starch branching enzyme IIb protein or enzyme construction is useful as markers for traits linked to those genes. This construction is useful in plant breeding in order to develop lines with consider and penson encoding homologous proteins from the same or other plant considers. They are also useful as DNA hybridisation probes or as construction fragment length polymorphism markers. Nucleic acid probes construction fragment length polymorphism markers. Nucleic acid probes constructed from the cDNA sequence may also be used for physical mapping or for fluorescence in situ hybridisation (FISH) mapping. The present construction constructs the wheat starch branching enzyme IIb cDNA from clone constructs.

A. tauschii is likely to be the ancestral D genome donor of wheat. Probes isolated F2 were used to identify type II starch branching enzymes (SBEs) in wheat, especially BEIIb. The BEIIb nucleic acids may be used to genetically transform cereal plants such as who are been and for altering their nutritional content by modulating the starch biosynthetic pathway to vary levels of amylopectin and/or amylose produced in the plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding wheat starch branching enzyme IIb, useful for altering the amylose and amylopectin content of cereal plants, e.g. wheat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 6; Fig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (CSIR )

BEIIb is a type II starch branching enzyme (SBE). The BEIIb nucleic acids may be used to genetically transform cereal plants such as wheat or barley and for altering their nutritional content by modulating the starch biosynthetic pathway to vary levels of amylopectin and/or amylose produced in the

                                                                                                                                                                                                        This invention, in the area of plant biotechnology, relates to novel polymicleotides comprising a nucleotide sequence encoding a protein which is involved in or associated with the synthesis, metabolism or degradation of carbohydrates in the plant grain and the expression of which is up-regulated during grain filling. The plant is selected from corn, tomato, banana, canola, cotton, peanut, sorghum, tobacco, sugarbeet, wheat, and rice. The invention may be useful for the improvement of protein, oil, starch, fibre and moisture content of the cereal grains. In addition, carbohydrate levels may be modified to a more desirable level using the present invention. The present sequence is a DNA sequence encoding a rice protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New plant genes encoding polypeptides having an activity involved in or associated with the synthesis, metabolism or degradation of carbohydrates in the plant grain useful in generating plants having improved nutritional properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oryza sativa.

Sequence 3, Application US/09609040

Patent No. 6570066

GENERAL INFORMATION:
APPLICANT: Willmitzer, et al.
TITLE OF INVENTION: MUCLEOTIDE SEQUENCES ENCODING ENZYMES THAT ALTER THE CARBOHYDRATI
TITLE OF INVENTION: CONCENTRATION AND COMPOSITION IN PLANTS
FILE REFERENCE: 514413-3515.1

CURRENT APPLICATION NUMBER: US/09/609,040

CURRENT FILING DATE: 190-06-30

PRIOR FILING DATE: 199-02-11

NUMBER OF SEQ ID NOS: 4

SOFTWARE: Patentin version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TYPE: DNA
ORGANISM: Triticum aestivum
